THE PROBLEM

WHAT WE WILL SOLVE

MILLIONS WITH UPPER LIMB AMPUTATIONS FACE BARRIERS IN A DIGITAL WORLD

Individuals with limb loss encounter significant challenges in accessing education, employment, and social opportunities due to difficulties using digital devices.

LACK OF ACCESSIBLE TECH SOLUTIONS LIMITS INDEPENDENCE AND INCLUSION

Without adaptive technology, those with upper limb amputations are disadvantaged in a society that increasingly relies on digital interactions.

EXISTING SOLUTIONS

WHAT'S OUT THERE

Several solutions currently aim to assist individuals with upper limb disabilities in overcoming digital access challenges. These include prosthetic limbs that range from basic cosmetic models to advanced bionic arms that offer functional movement, enabling users to perform various tasks.

Other technologies like voice recognition software and eye-tracking systems have also been developed to support computer interaction

PROBLEMS

WHY THEY DON’T WORK

01 High Costs and Complexity

Advanced prosthetic limbs are extremely expensive and require extensive training to operate, making them inaccessible to many who could benefit from them.

02 Limited Versatility

Technologies like voice recognition and eye-tracking, while useful, often fall short in handling complex tasks and may not be practical or effective in all situations.

03 Restricted Access in Resource-Limited Areas

In areas like Ghana, access to these advanced solutions is often limited, leaving a gap in support for individuals seeking digital independence and accessibility.

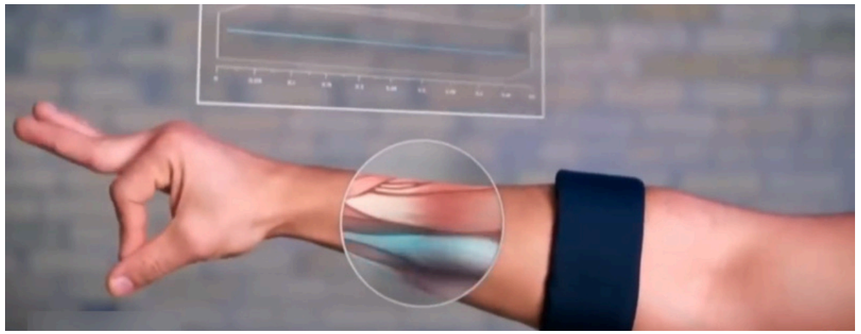

ƆDADEƐ EMG BAND

OUR INNOVATIVE SOLUTION

Introducing the ƆDADEƐ EMG BAND, a wearable wristband designed specifically for individuals with amputated arms. The primary goal of this innovative device is to bridge the gap between users with upper limb amputations and computer systems, enhancing their ability to interact with digital technology.

SOLUTIONS

WHY IT'S BETTER

Presec Stem Team

01 Affordable and Accessible Solution

Our solution provides a cost-effective alternative to advanced prosthetics, offering an accessible way for individuals with disabilities to interact with digital devices without prohibitive expenses or extensive training.

02 Versatile and Efficient Control

By using EMG sensors to convert muscle signals into digital commands, the wristband enables users to navigate complex computer tasks intuitively and effectively, with Bluetooth connectivity ensuring compatibility across various devices and environments.

03 Optimized for Comfort and Daily Use

Designed for comfort and ease of use, the adjustable ƆDADEƐ EMG BAND fits securely for prolonged wear, with an intuitive interface that minimizes learning time, empowering users to integrate it seamlessly into everyday life.

MARKET SIZE

OUR CLIENTS COME FROM EVERYWHERE

Our solution meets a critical global need, positioning us for substantial growth in a market with millions seeking better digital interaction tools.

Total Available Market (TAM)

Global Market Size: Approximately 35-40 million individuals living with upper limb amputations worldwide, with significant populations in both developed and developing countries.

Serviceable Available Market (SAM)

In Ghana, an estimated 500,000 individuals are affected by upper limb amputations, representing a substantial portion of the population. This target market includes individuals of all ages who face challenges in using digital technology, making them prime candidates for innovative solutions like the ƆDADEƐ EMG BAND.

Serviceable Obtainable Market (SOM)

We aim to capture 5-10% of the SAM in Ghana within the first 3-5 years, equating to around 25,000 to 50,000 potential users.

OTHER MARKETS

WHAT WE COULD DO

Presec Stem Team

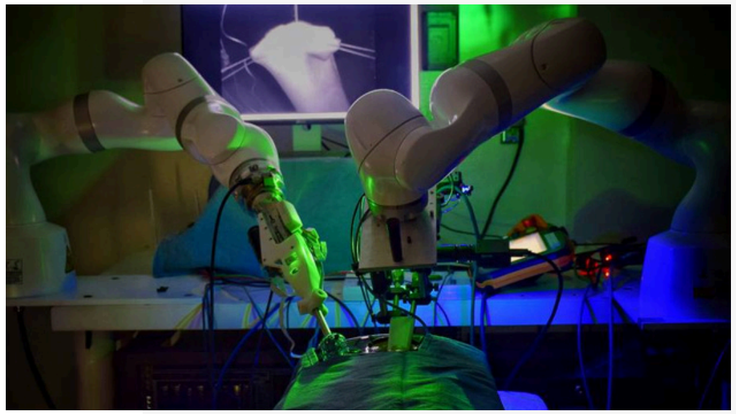

Gaming and Esports

The EMG BAND technology can be integrated into gaming and esports, allowing players to control characters and navigate virtual worlds using muscle signals, creating unique experiences.

Virtual Reality and Augmented Reality Experiences

The EMG BAND can enhance VR and AR experiences by allowing users to interact with digital elements in real-time using muscle signals, creating more immersive and intuitive environments.

Robotics Control

The EMG BAND can be employed in robotics, allowing users to control robotic arms or drones through muscle signals, enhancing human-robot collaboration in industries like manufacturing, logistics, and search and rescue operations.

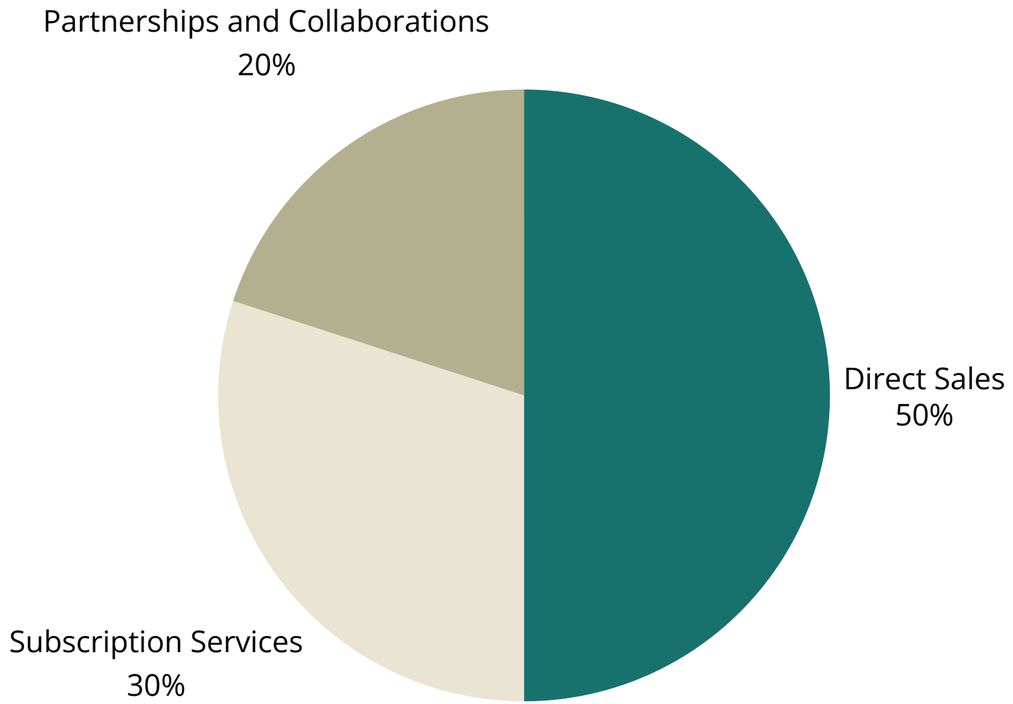

REVENUE STREAMS

HOW WE WILL MAKE YOU MONEY

Direct Sales: Selling the ƆDADEƐ EMG BAND directly to consumers, rehabilitation centers, and healthcare providers.

Subscription Services: Offering a subscription model for software updates, additional features, or cloud-based analytics for users and healthcare professionals.

Partnerships and Collaborations: Generating revenue through partnerships with organizations and institutions that promote assistive technologies and accessibility.

GO-TO-MARKET STRATEGY

HOW WE WILL BREAK INTO THE MARKET

01

Partnership Development

Collaborate with healthcare institutions and rehabilitation centers to integrate the EMG BAND into patient care programs, leveraging their networks to reach potential users effectively.

02

Nonprofits and NGOs

Partner with organizations that focus on disability rights and support to raise awareness and distribute the product to underserved populations.

03

Targeted Marketing Campaigns

Launch digital marketing initiatives, including social media outreach and educational webinars, to raise awareness and engage individuals with upper limb amputations and their support networks.
